Communication infrastructures as well as the protocols and technologies to be used in microgrids communication systems are not yet fully established, thus, the aim of this chapter is to identify the main components of the communication infrastructure and their. To solve this, researchers have recently started working on interoperable smart microgrids (ISMs) for urban communities. Here, a central monitoring and control station captures the energy generation/demand information of each microgrid and analyzes the availability/requirement, thereby executing. Microgrids are very dynamic structures that need continuous monitoring of their components and surroundings to guarantee an efficient energy management. To accomplish these functions, a dedicated sensor network and communication infrastructure are necessary to coordinate the control actions and to. battery energy storage system; modular multilevel converter; model predictive control; disturbance observer; AC current control; circulating current control; terminal sliding mode; DC-DC converter; disturbance observer; blockchain; decentralized market; integrated energy transaction; transaction.
