

Electrochemical energy storage in graphene

Overview

Graphene is a promising carbon material for use as an electrode in electrochemical energy storage devices due to its stable physical structure, large specific surface area ($\sim 2600 \text{ m}^2 \cdot \text{g}^{-1}$), and excellent electrical conductivity 5. Herein, a gap-enhanced Raman spectroscopic strategy is designed to characterize the dynamic interfacial process of graphene with an adjustable number of layers, which is based on synergistic enhancement of localized surface plasmons from shell-isolated nanoparticles and a metal substrate.
