

## Overview

---

Solar grid connect inverters are also called "string" inverters because the PV modules must be wired together in a series string to obtain the required DC input voltage, typically up to 600 VDC in residential systems and up to 1,000 VDC for commercial and industrial systems.

Assuming the initial DC-link voltage in a grid-connected inverter system is 400 V,  $R = 0.01 \Omega$ ,  $C = 0.1F$ , the first-time step  $i=1$ , a simulation time step  $\Delta t$  of 0.1 seconds, and constant grid voltage of 230 V

Grid-tie inverters convert DC electrical power into AC power suitable for injecting into the electric utility company grid. The grid tie inverter (GTI) must match the phase of the grid and maintain the output voltage slightly higher than the grid voltage at any instant. A high-quality modern grid-tie inverter has a fixed unity power factor, which means its output voltage and current are perfectly lined up, and its phase angle is within 1° of the AC power grid. The inverter has an internal computer that senses the current

### How Does Input Voltage Affect a Grid-Tie Inverter?

The grid tie inverter is generally adjusted by PWM. There is a term called duty ratio, which is equal to the component series voltage/ DC bus

### How to Read Solar Inverter Specifications

The maximum DC input voltage is all about the peak voltage the inverter can handle from the connected panels. The value resonates with the
