

# How much power storage does the factory use

## Overview

---

The Power Storage is a mid-game building used for buffering electrical energy. Each can store up to 100 MWh, or 100 MW for 1 hour. I need a brief explanation of power storage. Let's say my factory has a consumption of 1000 MW and I switch off all coal-fired power plants and biomass burners. When connected to a power grid that is supplied by. My current total consumption now is about 35 GW, which is getting very close to my 36 GW capacity, and I'm worried that while building my nuclear power plant and turning on all the machines as I go, I'm going to exceed my power capacity before the plant comes fully online. If the batteries complain about draining sometimes you know it is time to spend some time on your power grid ;-). Don't like them really, they need high tier stuff like supercomputers but have only a power output which suits low to mid-tier.
