

# Low-pass filter in DC microgrid

## Overview

---

This paper analyzes the impact caused by large droop coefficients from loop-gain perspective, and proposes a low pass filter method to avoid the significant DC bus voltage variations, which is harmful to the power quality and voltage-based control strategies. DC microgrids are getting more and more applications due to simple converters, only voltage control and higher efficiencies compared to conventional AC grids. Droop control is a well know decentralized control strategy for power sharing among converter interfaced sources and loads in a DC. Droop control is one of the most widely applied control method in interface converters for a DC microgrid. The cut off frequency can be varied by varying the capacitance of the low-pass filter. MG can operate in islanding mode or grid-tied [9-11].

## Four types of Droops for DC

Low pass filter (LPF) in the feedback of the droop control is used to ensure converter passivity. Bus impedance is derived to ensure system passivity with less conservativeness.
