

Part of the solar panel does not generate electricity

Overview

This means your solar panel is generating voltage (open circuit), but the circuit is incomplete and therefore cannot generate current. This could be due to a loose or broken wire, a faulty inverter or charge controller, a poor connection, or an internal problem with the panel. Whether you are a new solar panel owner or have been using solar energy for years, knowing the potential problems can help you maintain optimal. According to the National Renewable Energy Laboratory (NREL), solar systems typically operate with over 95% reliability, meaning issues are usually preventable or easily diagnosed. Soiling is the #1 culprit: Dirt. Solar panels producing 30-50% below expected output usually indicates dirt buildup, partial shade, or temperature effects-not panel failure. A 100W panel rated for 100W at 77°F will only produce 70-80W on a 95°F day, and that's normal.
