

Photovoltaic system energy storage research

Overview

Much of NLR's current energy storage research is informing solar-plus-storage analysis. Energy storage can provide multiple grid services. It can support grid stability, shift energy from times of peak production to peak consumption, and reduce peak demand. For solar-plus-storage-the pairing of solar photovoltaic (PV) and energy storage technologies-NLR researchers study and quantify the economic and grid impacts of distributed and utility-scale systems. Energy storage system integration can reduce electricity costs and provide desirable flexibility and reliability for photovoltaic (PV) systems, decreasing renewable energy fluctuations and technical constraints. Sometimes two is better than one.
