

Reverse communication to base station

Features and applications:
Power 1000W/1500W

4G/LTE/5G

Overview

The Reverse Traffic Channel carries (or other user data) and network signaling data from mobile to the base station, while the Access Channel is used by the mobile to request the base station to set up a call and to respond to Paging Channel messages (call set-up by the. The Reverse Traffic Channel carries (or other user data) and network signaling data from mobile to the base station, while the Access Channel is used by the mobile to request the base station to set up a call and to respond to Paging Channel messages (call set-up by the. The Forward CDMA channel is the cell-to-mobile direction of communication or the downlink path. It consists of: Pilot Channel is a reference channel which the mobile station uses for acquisition, timing and as a phase reference for coherent demodulation. It is transmitted at all times by each base. Uplink is the communication link that transmits the signal from the mobile phone to the network base station (eNodeB, gNodeB, etc. The names used within IS-95 and cdma2000 are different to those used for GSM and UMTS. For the IS-95 air interface, the convention is: Forward link: the link. The base station uses these pages to transmit system overhead information and mobile station specific messages. Forward Traffic Channel – Forward Traffic Channels are code channels. The wireless telecommunications industry requires engineers who can design, and understand the engineering trade-offs that must be made in any system.

Reverse communication to base station
