

What are the high temperature panels in photovoltaic plants

Overview

Solar thermal technologies are categorized as low-temperature, medium-temperature, or high-temperature. High-temperature solar thermal (HTST), also known as concentrating solar thermal (CST), is used for electrical power generation. Although July and August bring the most intense solar irradiation, high temperatures often cause plant output to fall short of that in spring or early summer, as rising temperatures significantly reduce module efficiency and make it difficult for the system to maintain optimal performance.

Temperature Coefficient is Critical for Hot Climates: Solar panels with temperature coefficients of $-0.30\%/^{\circ}\text{C}$ or better (like SunPower Maxeon 3 at $-0.27\%/^{\circ}\text{C}$) can significantly outperform standard panels in consistently hot climates, potentially saving thousands in lost energy production over the. But in reality, high temperatures can reduce PV module efficiency by over 20%. This hidden performance loss affects solar power plants, especially during peak summer months. Have you ever felt a little sluggish on a hot summer day?

Well, solar panels can feel that way, too.
